*October 2025*

## Field Surveys

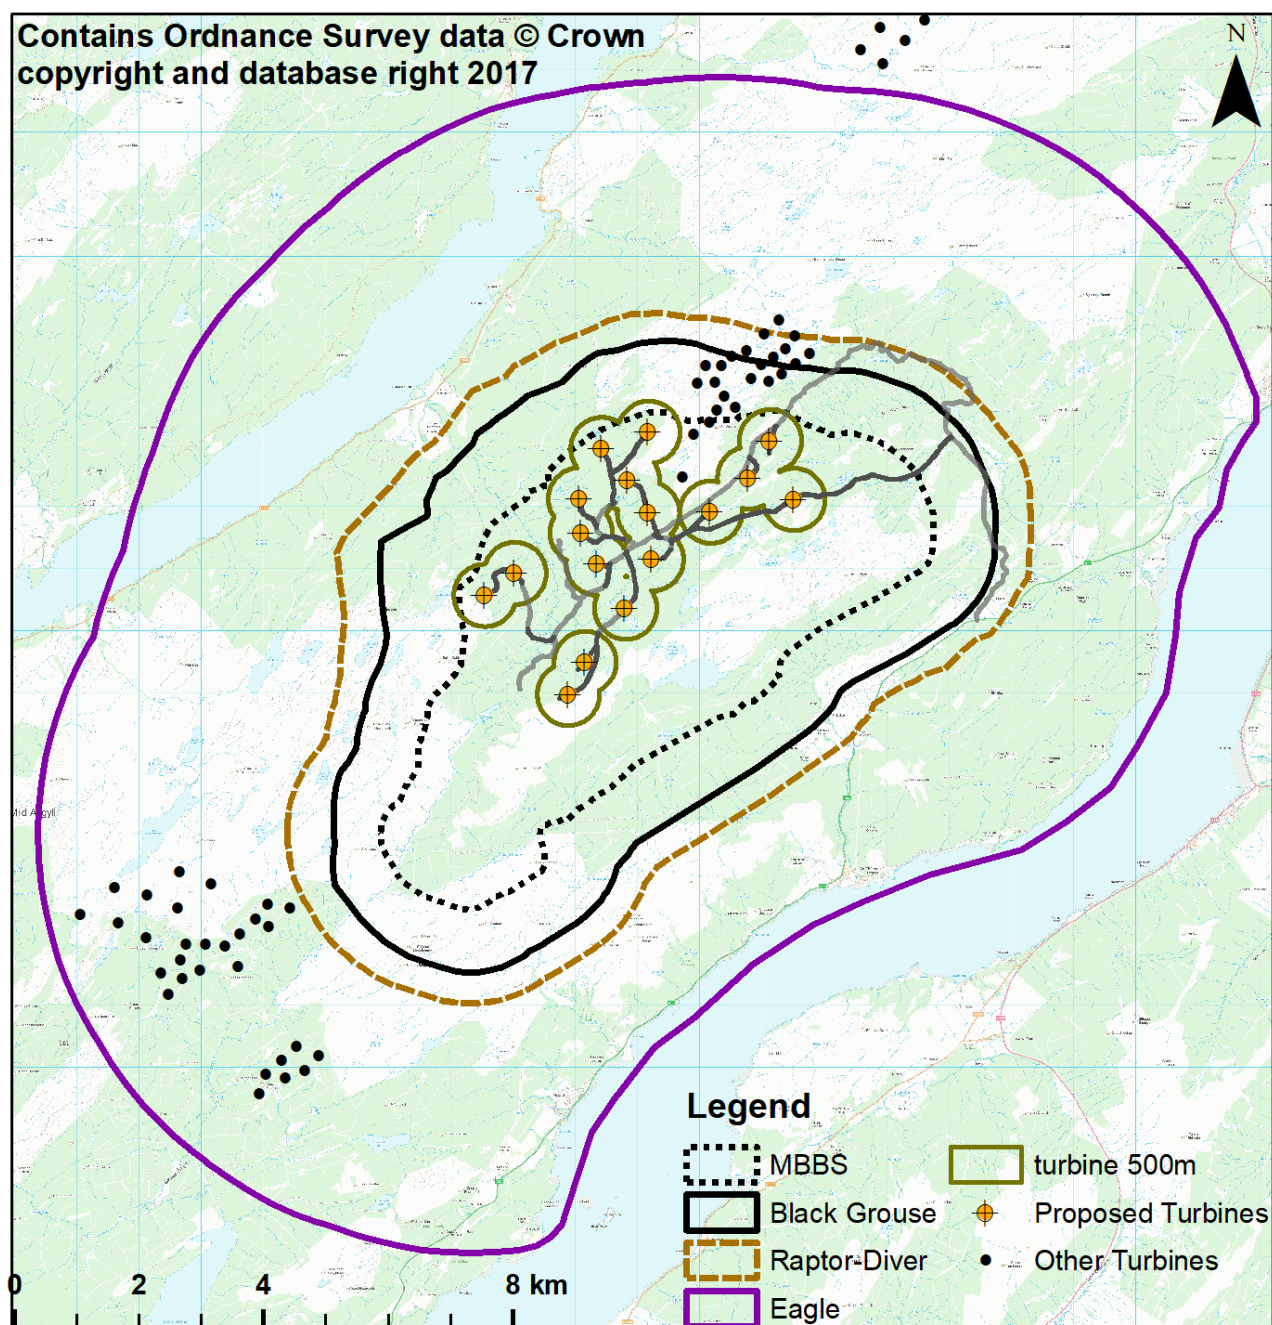

1. Baseline ornithological field surveys were conducted for the Proposed Development from 26<sup>th</sup> March 2019 to April 1<sup>st</sup> 2022. Additional VP and eagle surveys took place from March to August 2025.
2. All field surveys were undertaken following appropriate industry standard guidance and species-specific methodologies (Gilbert *et al.*, 1998, Hardey *et al.*, 2013 and SNH, 2017), with the following surveys completed over a consecutive two-year period:
  - Flight activity surveys – March 2019 to April 2022 and March 2025 to August 2025;
  - Black grouse surveys – Spring 2019 and 2020;
  - Raptor and diver breeding bird surveys – spring/summer 2019 and 2020, with additional eagle surveys in 2025; and
  - Moorland breeding bird surveys (MBBS) – spring/summer 2019 and 2020.
3. Details of survey effort and the results are in **Annex A** and the nest sites of Schedule 1 breeding species are in **Annex B**. Field survey areas were defined with reference to the contemporary NatureScot guidance (SNH, 2017<sup>1</sup>) and on the basis of the maximum developable turbine area available at the time of survey commencement and completion. Figure 1 shows the areas surveyed.
4. Eight vantage points (VPs) were identified using a GIS and satellite imagery (to identify current open areas). Initial locations were subsequently ground-truthed and amended if needed (Table 1). Locations were constrained by access restrictions, topography and forest cover. All VPs were restricted to a 2,000 m horizontal detection limit and a vertical detection threshold of 40 m. It was assumed that the surveyor eye level was 1.5 m. Viewsheds were generated using an OS Terrain ® 5 m DEM. All view sheds assumed a 180° horizontal detection zone given by azimuths 1 & 2 in Table 1.

Table 1. Vantage Point locations and directions

| VP | Azimuth1 | Azimuth2 | X      | Y      |
|----|----------|----------|--------|--------|
| 1  | 25       | 205      | 198605 | 705966 |
| 2  | 235      | 55       | 201566 | 704669 |
| 3  | 357      | 177      | 197167 | 704711 |
| 4  | 30       | 210      | 196796 | 703517 |
| 5  | 175      | 355      | 200459 | 703770 |
| 6  | 225      | 45       | 197208 | 702672 |
| 7  | 215      | 35       | 199318 | 706627 |
| 8  | 160      | 340      | 197255 | 706172 |

<sup>1</sup> NatureScot (2017). Recommended bird survey methods to inform impact assessment of onshore wind farms. V.2.

Figure 1. Survey areas. Contains Ordnance Survey data © Crown copyright and database right 2020.

5. VP locations and their viewsheds are shown in Figure 2.
6. VP surveys started on 26<sup>th</sup> March 2019 and ended on April 1<sup>st</sup> 2022. Details of VP surveys are in **Annex A**.
7. Despite Covid-19 restrictions all surveys were completed and all VPs were surveyed for at least six hours each month of their survey period.
8. Between March and August 2019 surveys were carried out from five vantage points (VP1 – VP5).
9. VP6 was added in August 2019, plus two VPs targeted specifically at diver activity (D1 and D2). The diver VPs do not contribute to collision calculations. Survey work from VP6 continued until July 2021.
10. VP7 was added in May 2020, and VP8 started in March 2021, both were surveyed until March 2022 (last surveys April 1<sup>st</sup> 2022).
11. VP surveys were repeated between 18<sup>th</sup> March 2025 and 14<sup>th</sup> August 2025 from all VPs except VP 6 which was considered redundant following a redesign of the layout.
12. No overlapping viewsheds were surveyed simultaneously. Surveys lasted for up to three hours, with a minimum 30-minute break between surveys by the same surveyor.
13. Details collected during these surveys include Species, Time, Duration, Flight height, Number of Birds, and Flight path (digitized from field maps). Flight height was recorded in 15 second intervals and split into four categories: 1 <40 m; 2 40-140 m; 3 140-200 m; and 4 >200 m.

### **Flight Activity**

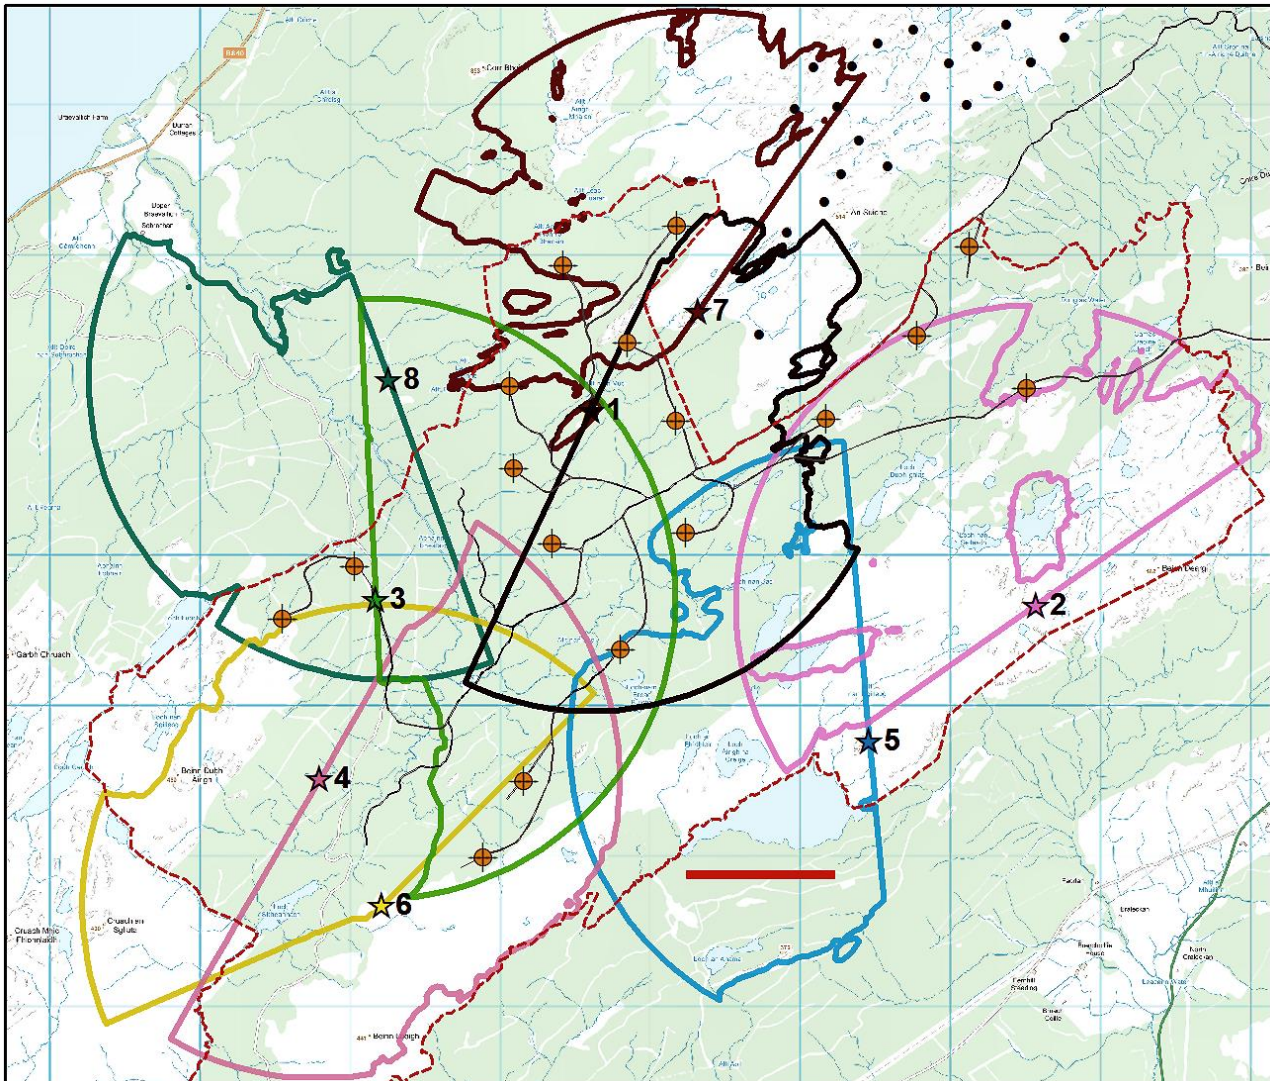

14. Survey effort from each VP during each season is summarised in Table 2.

*Table 2. Flight Activity Survey Effort (h) 2021-2023*

|               | Vantage Point |    |    |    |    |    |    |    |
|---------------|---------------|----|----|----|----|----|----|----|
| Season        | 1             | 2  | 3  | 4  | 5  | 6  | 7  | 8  |
| 2019 BR       | 36            | 36 | 36 | 36 | 36 | 6  | 0  | 0  |
| 2019/2020 NBR | 36            | 36 | 36 | 36 | 37 | 36 | 0  | 0  |
| 2020 BR       | 36            | 36 | 36 | 36 | 36 | 72 | 36 | 0  |
| 2020/2021 NBR | 36            | 36 | 36 | 39 | 36 | 36 | 36 | 0  |
| 2021 BR       | 0             | 0  | 0  | 0  | 0  | 30 | 36 | 36 |
| 2021/2022 NBR | 0             | 0  | 0  | 0  | 0  | 0  | 36 | 36 |
| 2022 BR       | 0             | 0  | 0  | 0  | 0  | 0  | 12 | 12 |
| 2025 BR       | 36            | 36 | 36 | 36 | 36 | 0  | 36 | 36 |

*For the purposes of this summary BR = breeding season (Mar - Aug), NBR is the rest of the year.*

Figure 2. Viewshed survey coverage from eight VPs (coloured stars). Viewsheds are based on a 5m DEM. Also shown is the proposed infrastructure and the An Suidhe turbines (black circles). The horizontal red bar is 1km. Contains Ordnance Survey data © Crown copyright and database right 2020.

15. Flight activity was recorded 13 target species over the course of surveys (Tables 3 & 4).

Table 3. Flight Activity Survey Results 2021-2023. Total time (s) is the product of the flight duration multiplied by total number of individuals. Not all of these flights at collision risk. No target species were seen during the 2022 Breeding Season surveys.

### Golden Eagle

17. Golden Eagles were seen across the site (Figure 3) but were predominantly present between March and May. [REDACTED]

18. [REDACTED] a very robust assessment of the potential impact can be undertaken.

19. [REDACTED] we can be very confident about the current home range limits (see **Appendix 5A**).

20. Fielding et al. (2024a) has shown that males and females in a pair have similar home ranges so the absence of tag records from females is unlikely to have created a significant bias.

[REDACTED]

21. The GET model (**Appendix 5A**) is a detailed analysis of potential habitat loss arising from the construction of the Revised Development. As Golden Eagles spend a large proportion of their time roosting or perching the analysis also considers potential impacts on roosting and perching locations.

22. The conclusions from the GET analysis were that neither the estimated losses of [REDACTED] and the limited extent of good eagle habitat within a 300 m turbine exclusion buffer, there will be no significant impact on habitat used by dispersing Golden Eagles.

23. [REDACTED]

24. [REDACTED]

25. [REDACTED]

26. [REDACTED]
27. [REDACTED]

#### ***White-tailed Eagle***

28. There was little white-tailed eagle flight activity recorded during the initial VP surveys and no nesting attempts were located between 2019 and 2022.
29. [REDACTED]
30. As expected, there was an increase in the number of White-tailed Eagle flights recorded from VPs in 2025 but the amount of at-risk flight activity was insufficient to result in a large increase in the collision risk.

#### ***Hen Harrier***

31. There was little Hen Harrier activity recorded during VP surveys and no nesting attempts were seen. Most recorded activity was from VPs 5 & 6 and all between March and September.

#### ***Other Raptors and Owls***

32. There was no evidence of other raptor species breeding within the Site during the baseline period.
33. Relatively few observations of non-target species were made during VP watches and these were dominated by Raven and, to a lesser extent, Buzzard. Kestrel and Sparrowhawk were recorded occasionally.
34. [REDACTED] The Raven nest had three chicks on 7<sup>th</sup> May 2025.

#### ***Divers***

35. In 2019, divers, mainly Red-throated Diver, were seen on eight lochans. [REDACTED]
36. [REDACTED] It is assumed these were the same birds.
37. [REDACTED]
38. [REDACTED]

- [REDACTED]
39. In 2025 no Red-throated Diver breeding attempts were recorded.
40. Red-throated diver flights were not very abundant with seven of the twelve VP records recorded from VP D in July 2021.

### **Black Grouse**

41. In 2019, there were eleven records of single birds on the ground, six within the proposed wind farm. There were three records of Black Grouse in flight, one (2 females) was within the proposed wind farm. In 2020, there were eight records of single birds on the ground, six within the proposed wind farm.
42. Single displaying males were seen in ten locations, all southeast of the Revised Development. A single male was seen displaying in March 2020 ~175 m from a proposed track and 400 m from the nearest proposed turbine. The next closest displaying male to any infrastructure was 370 m from a proposed track and 600 m from the nearest turbine. All other records of displaying males were at least 600 m from the nearest infrastructure.
43. No evidence of nesting was found, however because such behaviour is difficult to observe breeding on the Site cannot be ruled out.

### **Waders**

44. In general, waders were rarely recorded in any survey.
45. A single Golden Plover flight of two individuals was seen during a VP survey in late August 2020. Snipe were recorded four times, three on the same day in May 2020. A single flight of 28 Lapwing was recorded in February 2021.
46. During other bird surveys the most common wader was the Common Sandpiper, recorded 13 times mainly in June 2019. There were three Snipe records and single recordings of Greenshank and Golden Plover.

### **Other Target Species**

47. In 2019 Whooper Swan were seen on three lochans in March, April and May and a single flight of seven birds was observed outside of the proposed wind farm on the 28<sup>th</sup> March 2019. In June 2020 a single Whooper Swan was seen feeding close to Loch Dubh-ghlas.
48. Canada Goose were occasionally recorded above the Site in small groups (maximum 4) during mainly April and May.
49. No gulls were recorded during any surveys.

### **Other bird surveys**

50. There were 575 hours of other bird surveys (Table 6), plus an additional 116 hours of eagle surveys in 2025. Some surveys were combined. Dates, timings and weather conditions of the bird surveys are in **Annex A**.
51. Moorland Breeding Bird Surveys MBBS surveys used an adapted Brown and Shepherd (1993) method. Only open habitats were covered by the survey with four visits completed during the breeding season (as per SNH, 2017).
52. Bird locations and behaviour were mapped to 1:25,000 scale using standard British Trust for Ornithology (BTO) Common Birds Census (CBC) notation. Supplementary behavioural observations and notes were made to determine breeding locations as accurately as

possible. Birds were recorded systematically for at least 20 minutes, standardising the search effort per unit area. Surveys were carried out during daylight hours; avoiding strong winds, heavy rain, fog and low cloud. Walking, listening and scanning by eye and with binoculars were the methods used to locate the birds. Particular attention was given to any topographical and vegetation features likely to influence bird distribution. Birds were considered to be breeding if they were observed singing, displaying, carrying nest material, if nests or young were found, or evidence was observed of repetitively alarmed adults, disturbance displaying, or birds carrying food or in territorial dispute.

53. Habitat within and surrounding the Revised Development contains areas suitable for breeding and lekking black grouse. Surveys followed the methodology described in Gilbert et al. (1998). The survey area was a buffer around the proposed turbines of, at a minimum, 1.5 km from nearest proposed turbine.
54. Surveys were undertaken in line with NS guidance and following the species-specific methodologies outlined in Hardey et al. (2013) with eagle surveys extending to 6 km beyond the site boundary and 2 km for all other raptors. The surveyors monitored all areas of potential raptor breeding habitat within the site, plus the species-specific buffers. Eagle and Raptor Surveys were a combination of walkovers and vantage point watches. If there was evidence of territoriality there would a subsequent nest search, under Schedule 1 Licence.
55. Breeding Diver Surveys were based on the methods described in Gilbert et al. (1998) and involved checking lochs for diver activity and signs of breeding by red-throated diver or black-throated diver within 2 km of the Core Study Area.

*Table 6. Bird survey duration (h) by year, type and month. MBBS – Moorland Breeding Bird Survey; BK – Black Grouse and; WWO – Winter Walkover*

| Year | Survey(s)      | Jan | Feb | Mar  | Apr  | May  | Jun  | Jul  | Aug  | Sep | Oct | Nov | Dec | Year  |
|------|----------------|-----|-----|------|------|------|------|------|------|-----|-----|-----|-----|-------|

| 2021 | Diver          | 6.0 | 6.3 |      |      |      |      |      |      |     |     |     |     | 12.3  |
|      | WWO            |     |     | 6.3  | 6.0  |      |      |      |      |     |     |     |     | 12.3  |
| 2025 | EAGLE          |     |     | 14.0 | 35.0 | 27.2 |      | 23.0 | 16.8 |     |     |     |     | 116.0 |

56. Most records, during MBBS, WWO, diver and raptor surveys were in the larger patches of open ground.
57. Raven and Buzzard were the most abundant non-target species recorded during VP watches. Both were present throughout the year (Table 7). Other species were rarely seen.
58. Ducks and water birds (Cormorant, Goosander, Little Grebe, Mallard, Teal and Tufted Duck)

were seen on most of the larger lochans in 2019 and 2020. Common Sandpiper was the most recorded wader.

*Table 7. Number of non-target individuals recorded across all VPs by month.*

| Species                  | J  | F  | M  | A  | M  | J  | J  | A  | S   | O   | N  | D  | Year |
|--------------------------|----|----|----|----|----|----|----|----|-----|-----|----|----|------|

## Collision Risk

59. The collision risk calculations are provided in **Appendix 5C**.

60. Table 9 is a summary of the collision calculations.

61. None of the collision estimates appears to be large enough to create a significant population level impact. Based on recent research, and evidence from the tagged birds and existing wind farms in their ranges, the collision estimate for Golden Eagle are almost certainly too high and it is unlikely there will be a significant local impact. It might be expected that White-tailed Eagle activity will increase relative to what there was during the survey periods. However, there is no evidence, particularly in Argyll and Kintyre, that the presence of wind farms is slowing the expansion of the population.

Table 9. Summary of collision estimates

| Species            | Avoidance | Mean  | Lower | Upper | Years to 1 death | 40-year deaths |
|--------------------|-----------|-------|-------|-------|------------------|----------------|
| Golden Eagle       | 99.0%     | 0.093 | 0.008 | 0.178 | 10.8             | 3.7            |
| Osprey             | 98.0 %    | 0.079 | 0.009 | 0.149 | 12.7             | 3.2            |
| Red-throated Diver | 99.5%     | 0.036 | 0.003 | 0.068 | 27.8             | 1.4            |
| White-tailed Eagle | 95.0%     | 0.111 | 0.065 | 0.156 | 9.0              | 4.4            |

62. VPs surveys were repeated during the 2025 breeding season. Table 10 is a comparison of the bird densities which would contribute to the estimated number of collisions. The derivation of Year 1 and Year 2 breeding season bird densities is given in **Appendix 5C**. Note that 2025 uses data from all VPs, except VP6, so there are some differences in the VPs contributing to the bird density estimates.
63. No at-risk golden eagle flights were seen in 2025 so the inclusion of 2025 would have reduced the number of estimated collisions whilst increasing the width of the confidence interval.
64. There was less at-risk Osprey flight activity in 2025 so the inclusion of 2025 would have reduced the number of estimated collisions whilst increasing the width of the confidence interval.
65. There was less at-risk Red-throated Diver flight activity in 2025 so the inclusion of 2025 would have reduced the number of estimated collisions whilst increasing the width of the confidence interval.
66. The amount of at-risk White-tailed Eagle flight activity in 2025 was similar to that seen previously, so the inclusion of 2025 would not have significantly increased the number of estimated collisions.

Table 10. Comparison of bird densities (turbine weighted birds km<sup>-2</sup>) used in CRM

| Species            | Year 1 BR | Year 2 BR | 2025 BR  |
|--------------------|-----------|-----------|----------|
| Golden Eagle       | 0.000482  | 0.000119  | 0.000000 |
| Osprey             | 0.000149  | 0.000268  | 0.000067 |
| Red-throated Diver | 0.000189  | 0.000440  | 0.000021 |
| White-tailed Eagle | 0.000078  | 0.000064  | 0.000072 |

## White-tailed eagle: General notes about population models

67. [REDACTED]
68. [REDACTED]
69. [REDACTED]

70. Estimates from collision models are not wholly accurate (empirical evidence based on the difference between what has been predicted and what has happened) but a realistic assumption is that the number of collision deaths will rise if either the number of turbines increases or the number of birds increases. In reality, both can be increasing but not necessarily at the same rates. The number of collisions should not be fixed in such circumstances. To reflect an inevitable increase in the number of collisions, collision rates need to grow as the population grows, but how this is incorporated into models is complicated by the spatial overlap between turbines and the species being modelled.
71. Parameter values, specifically productivity and annual survival rates, are a significant limitation of a population model. NS appears to be concerned about the inadequacies of productivity values derived from SRMS data. In reality, as shown below, productivity is relatively unimportant compared with adult survival rates for long-lived species. Survival rates are generally poorly understood, extrapolated from other populations or unknown.
72. Parameter elasticity is a measure of the proportional contribution a parameter makes to the overall population growth rate; parameters with larger elasticities require greater precision. The following are the results from simple simulations<sup>2</sup> in which productivity (f) and adult annual survival (v) rates are varied. For simplicity, a fixed annual juvenile survival rate of 0.4 is assumed. Note that the reproductive rate elasticity is always considerably less than the annual adult survival rate elasticity, but their ratio depends on their relative values.

*Annual growth rate (values above 1 are an expanding population)*

| adult survival | annual productivity (females fledged per pair) |       |       |       |       |
|----------------|------------------------------------------------|-------|-------|-------|-------|
|                | 0.3                                            | 0.4   | 0.5   | 0.6   | 0.7   |
| 0.6            | 0.702                                          | 0.731 | 0.758 | 0.784 | 0.808 |
| 0.7            | 0.804                                          | 0.834 | 0.862 | 0.889 | 0.914 |
| 0.8            | 0.906                                          | 0.937 | 0.966 | 0.993 | 1.020 |
| 0.9            | 1.007                                          | 1.039 | 1.068 | 1.097 | 1.124 |
| 0.95           | 1.058                                          | 1.090 | 1.120 | 1.149 | 1.176 |

<sup>2</sup> Using the R popbio library: `A<-matrix(c(0, v, 0.4, v]), nrow=2, byrow=TRUE)`

### *Reproductive rate elasticity*

| adult survival | annual productivity (females fledged per pair) |       |       |       |       |
|----------------|------------------------------------------------|-------|-------|-------|-------|
|                | 0.3                                            | 0.4   | 0.5   | 0.6   | 0.7   |
| 0.6            | 0.127                                          | 0.152 | 0.173 | 0.190 | 0.205 |
| 0.7            | 0.115                                          | 0.139 | 0.158 | 0.175 | 0.190 |
| 0.8            | 0.105                                          | 0.127 | 0.146 | 0.163 | 0.177 |
| 0.9            | 0.096                                          | 0.118 | 0.136 | 0.152 | 0.166 |
| 0.95           | 0.092                                          | 0.114 | 0.132 | 0.147 | 0.161 |

### *Annual adult survival rate elasticity*

| adult survival | annual productivity (females fledged per pair) |       |       |       |       |
|----------------|------------------------------------------------|-------|-------|-------|-------|
|                | 0.3                                            | 0.4   | 0.5   | 0.6   | 0.7   |
| 0.6            | 0.745                                          | 0.696 | 0.655 | 0.620 | 0.591 |
| 0.7            | 0.770                                          | 0.723 | 0.683 | 0.649 | 0.620 |
| 0.8            | 0.791                                          | 0.745 | 0.707 | 0.674 | 0.645 |
| 0.9            | 0.808                                          | 0.764 | 0.728 | 0.696 | 0.667 |
| 0.95           | 0.815                                          | 0.773 | 0.737 | 0.705 | 0.677 |

73. The reproductive rate elasticity is at its maximum of 34.7% of the adult survival rate when adult survival is low (0.6) and productivity is high (0.7). Conversely, it is at its lowest (11.3%) when adult survival is high (0.95) and productivity is high (0.3).
74. The relative importance of the adult survival rate is apparent if multiple models are run with very small changes to the adult survival rate. Assuming a juvenile survival rate of 0.4 and a productivity of 0.6 the annual population growth rates for adult annual survival rates of 0.90, 0.91, 0.92, 0.93, 0.94 & 0.95 are 9.69%, 10.72%, 11.75%, 12.79%, 13.82% and 14.85%. Thus, the annual rate of population growth is over 50% greater if the adult annual survival rate changes from 0.90 to 0.95. This is only a 5.6% increase in the adult annual survival rate but the effect is large enough to change the impact of additional wind farm mortality from significant to insignificant. Annual adult survival rates are not known with this level of precision for any UK raptor.
75. If survival rates are held constant at 0.4 and 0.9 but productivity is varied from 0.6 to 0.66 (10% increase) the estimated annual growth rate changes from 9.69% to 11.34%. This 17% increase in the growth is a much smaller change for a larger proportional change in the productivity parameter value. This emphasizes the importance of survival rates compared with productivity.
76. [REDACTED]

### **Counterfactual models**

77. Counterfactual models [REDACTED] ignore density dependence and compare population trajectories with and without additional wind farm mortality. This approach, as used in these models, has merit if the modelled population is not close to the potential carrying capacity for the modelled region. Irrespective of the species, all habitats have maximum sustainable population sizes – the carrying capacities. These can be difficult to identify with certainty but there are values which are clearly too small or too large. In the event that a population approaches its carrying capacity there will be biological consequences, which are usually a combination of reduced productivity (fewer young produced per breeding attempt) and reduced survival, resulting from direct intra-specific

effects, such as the killing of one bird by another, or insufficient prey resources. These are density dependent processes because the intensity of the effect is determined by the number of individuals in the modelled region.

78. The only problem with a density dependent model is identifying a realistic carrying capacity. Using one that is too low underestimates the magnitude of impact of additional deaths and *vice versa*. Therefore, it is good practice to overestimate the carrying capacity. It is impossible to believe there would be no density dependence operating if there were over 1,000 white-tailed eagles in Argyll.
79. It has been argued, for example by RSPB, that counterfactual models are appropriate for assessing wind farm impacts because they are relatively insensitive to uncertainties around the magnitude, variability and trends of demographic rates in the model (driven by legitimate concerns about offshore wind farms). As the same uncertainties apply to both null and wind farm deaths scenarios it might be a more robust approach. [REDACTED]  
[REDACTED] Modelled population sizes, with no density dependence, could never be accepted as realistic for an expanding species or one thought to be at, or near, its carrying capacity during the simulated population growth.
80. Using a counterfactual model, with no density dependence, means replacing a plausible model, which has a cautious carrying capacity, with a comparison of two modelled population trajectories which have no basis in reality. This is not robust.
81. Even if the counterfactual approach is accepted, an assessment of the magnitude of the impact is subjective. The longer models run, the more unrealistic scenarios become, and the larger the impact becomes as the gap between the null model and the collision model inevitably widens. There is no guidance, based on any objective scientific criteria, on how, or at what time, two population trajectories should be compared. It is an approach which, in the face of even tiny mortality, must result in a divergence of the model trajectories. So, if run long enough the difference must inevitably become large.
82. A counterfactual approach might be reasonable if there was informed guidance about the time the models should stopped and compared, and how different population trajectories have to be at that time to be significant. In the absence of such guidance, it is easy to choose a duration and a significance level demonstrating either no significant impact or a very significant impact.
